New Flatform Tank with Stormwater Attenuation Exhibited at Ecobuild 2015

A New Flatform Tank with integrated stormwater attenuation will be launched at Ecobuild 2015 to add to the existing Flatform range of innovative rainwater harvesting solutions. This shallow easy to install unit is a fully integrated rainwater harvesting system, comprising a filter diverter; polyethylene tank, pump package and automatic mains water back up. The Flatform range now includes the option of a stormwater attenuation feature that allows all or part of the tank capacity to be dedicated to helping manage site run-off through a throttle valve that can be set to the discharge rate required. The system offers the following benefits compared with conventional subterranean tank and crate systems:

1. Full range of tank sizes from 1 500 to 15 000 litres
2. Rigid water tight units ready for connection to underground drainage
3. Tank connection kit to assemble larger capacity systems
4. Designed to be sited in a shallow excavation starting from 1.1 m
5. Can be installed in most ground conditions without the need for a concrete base or collar
6. Optional reinforced tank shaft and cover to provides dive-on capability
7. Factory fitted throttle valve set to the required discharge rate

The introduction of this New Flatform System continues to set industry standards for ease of installation, reliability and affordability. The product range is designed to harvest rainwater for toilet flushing and garden irrigation and attenuate stormwater run-off. It is ideal for domestic and light commercial installations.

“Rainwater harvesting and attenuation systems have to be affordable, reliable and easy to install and maintain; and in an urban environment limited space makes the shallow Flatform a very competitive solution” said Graham Cross, Managing Director, “By combining rainwater harvesting and stormwater attenuation in a single system we aim to simplify and reduce the installed cost of these services and it is only by achieving this and expanding the market for these systems can we hope to meet national water efficiency and stormwater management targets.”

About the Flatform Range

Introduced in 2011 to meet the demand for urban rainwater harvesting. Flatform offers a range of modular tanks, filters, pumps and mains top up units designed for below ground installation providing simple and affordable solutions when space and access is restricted or there are poor ground conditions. The product are ideally suited for domestic and light commercial property particularly as a retrofit solution.
